

## Accident Lawyers in NJ See Causes of Concern By Distracted Drivers

More than 1.1 million people die yearly as a result of traffic accidents, and that number is predicted to rise more than 60% by the year 2020 as the world's population increases. Out of that 1.1 million, New Jersey alone contributed to more than 700 of those deaths. This makes New Jersey one of the top places for a driver to be killed in a traffic accident. To make this statistic even worse, when New Jersey drivers were surveyed about how often they thought people were killed in traffic accidents almost half of the people surveyed severely underestimated the figure. This just goes to show that many drivers don't know how dangerous their roads are and don't know the inevitable danger of driving on New Jersey roads.

Distracted drivers, according to accident lawyers in NJ, cause an overwhelming majority of traffic accidents in the United States, causing anywhere between 30-50% of traffic accidents in the US. Distracted driving can be caused by a variety of things, with the most common being rubbernecking. Rubbernecking is caused when a driver takes their eyes off the road to look at something else. According to accident lawyers in NJ rubbernecking normally occurs when there is a traffic accident and other drivers slow down to look at the accident, which is deemed "rubbernecking." This causes motorists take their eyes off the road in front of them, and as a result of that they will often drive right into the car in front of them. Besides rubbernecking, other common distractions while driving are talking on the phone, changing a CD or radio station, or even reading a map when driving.

Accident Lawyers in NJ have dealt with many cases where innocent drivers have been injured as a result of other drivers being distracted. One way that you can keep you and your family safe while on the road is by using a hands free device when using your cell phone. This will allow you to keep both hands on the wheel and focus on driving. Also, distracted driving accidents are often caused when drivers are looking at maps. This can be avoided by using a Global Positioning System in your car. Using a Global Positioning System can be a huge advantage when you are going on long trips, or traveling to new locations. GPS systems, also known as Global Positioning Systems, allow the driver to insert a destination address and the GPS will use satellite information to orally direct you to the location. By using a GPS you will be able to keep your eyes on the road because the directions are given orally. One final way that a driver can cut down on the number of distractions while driving is by pulling over if they have to calm down a child in the backseat or change a CD. Why risk getting into an accident if you can just as easily pull over and deal with the situation? If you have been involved in a traffic accident with a distracted driver, contact [accident lawyer in NJ](#) to file a lawsuit.
